Abstract:	The impacts of body dissatisfaction have been widely studied among adolescent girls, but much less in women in mid-life. In this study, we evaluated the associations between body dissatisfaction, psychological health and behaviors used to manage age-related changes, in an online survey of 331 women aged 45-65. Body dissatisfaction, importance of appearance and aging anxiety were associated with higher depression scores. Moreover, importance of appearance and aging anxiety were associated with the probability of using "anti-aging" behaviors. It seems that with age, for a subgroup of women, the pressure to stay young may be added to that of staying thin.
