

Title:	Asset Growth and Firm Performance Evidence from Greece
Year:	2012
Author:	Anastasia Maggina, Angelos Tsaklanganos
Abstract:	This study provides evidence drawn from publicly traded companies in Greece on the predictability of assets growth with respect to firm performance. We employ discriminant analysis and a logit specification to test our models. Results indicate that assets growth is predictable at an 85.7% rate in large companies. This rate is high compared those in other prediction studies such as bankruptcy, qualified audit reports and going-concern opinions.
